

What alternative for such an unscientific concept as intelligent design does science offer us poor, deluded Christians in order to explain the origin of the universe? Why, none other than that of random, blind chance! Behold thy gods, o academia, that brought thee up from the primordial soup. Just think, a big bang that supposedly occurred billions of years ago has resulted in an orderly, operating system.

As are all good, sound theories, so this one too must certainly be observable, repeatable, and measurable. All we need do is to survey the many bomb sites of our violent world to see that explosions are indeed conducive to life, order, beauty, symmetry, complexity, and functionality. Perhaps we might even verify this noble theory by instructing our child to clean his room by tossing a stick of dynamite therein. But we find by all our attempts that this is just another exploded theory of origins that has blown up in the face of atheistic pseudo-science. Evolution attempts to make a man out of a monkey, but it only succeeds in making a monkey out of a man.

It has been well said that is a greater probability of an explosion in an alphabet soup company resulting in all of the letters falling together into the form of Webster's Dictionary, than of a big bang producing our wonderful universe. And yet this is to be scientific! It is enough to make one wonder, "Is there indeed intelligent life on planet earth?"
